noxx

Full Stack Developer

Uruguay · noxxzeraa@proton.me · github.com/noxxUY · noxxuy.github.io

Summary

I do frontend and backend on the web. I also like digging into how things work at a low level, with C, C++ and reverse engineering. Lately I've been making browser tools that open Minecraft worlds or GTA archives, showing them in 3D without uploading anything. I'm also building a co-op mod for GTA III.

Skills

Languages: TypeScript, JavaScript, Python, C, C++, HTML, CSS
Web: React, Astro, Node.js, Vite, Tailwind CSS, Three.js, WebGL
Tooling: Vitest, Puppeteer, Git, GitHub Actions, npm
Low level: Reverse engineering, IDA Pro, Binary file formats (RenderWare DFF/TXD, IMG, Minecraft Anvil/NBT), Game modding in C++ (GTA III, San Andreas)

Projects

CoopIII

Independent project · Since Sep 2026

Cooperative story mode multiplayer for GTA III. Up to 8 players share one Liberty City and play the story together. One player starts a mission and everyone plays it with them. It hooks the retail gta3.exe directly instead of shipping a modified binary.

- Syncs players, vehicles, combat, traffic, police, the clock, the weather, pickups and garages.
- Written from scratch against the original binary, reverse engineered with IDA Pro.

Technologies: C++, xmake, IDA Pro

Minevisor

Independent project · Since Aug 2026

Minecraft Java worlds in the browser, in 3D. Open a save folder and fly through the world in 3D, check the map, players, inventories, chunks and NBT. It can also move a player's inventory to another account. Everything is decoded on your machine, nothing gets uploaded.

- Textures streamed from Mojang's CDN through a precomputed byte-offset index instead of bundling assets.
- Supports saves from Minecraft 1.0 onward, including the legacy terrain formats.

Technologies: TypeScript, Astro, React, Three.js, Tailwind CSS
Live: https://minevisor.cc

Minevisor Live

Independent project · Oct 2026

A server plugin that streams a Minecraft server into Minevisor in real time. A plugin for Paper and Spigot, and a mod for Fabric. It runs a small web server inside the Minecraft server, so the browser connects straight to it with no backend in between. Players moving, blocks changing and inventories show up as they happen, and it can post to Discord.

- One link per server, revocable, with the world seed never sent to viewers.
- Discord announcements and a live status message, configured from in-game commands.

Technologies: Java, Paper, Fabric, TypeScript

IMG Editor

Independent project · Since Sep 2026

Browser-based IMG archive editor for GTA III, Vice City and San Andreas. Opens the game archives and lets you browse, extract, replace, add, delete and rebuild entries, with a 3D preview of every DFF model and TXD texture. Saves in place through the File System Access API. Nothing leaves your machine.

- RenderWare DFF and TXD parsers written from the binary format, including skinned peds and PS2-format textures.
- The test suite parses every model of real GTA III, Vice City and San Andreas installs.
- Texture lookup through .ide files, with a texture index built in the background when nothing matches.

Technologies: TypeScript, React, Vite, Tailwind CSS, Three.js, Vitest

RemotePSP

Independent project · Sep 2026

Streams a PSP's screen to a PC over Wi-Fi. A plugin running on the PSP captures the screen, compresses it and sends it over UDP, both in the menu and inside games. A small receiver on the PC shows it in a window you can capture with OBS.

- Lost packets are recovered over the PSP's weak 802.11b Wi-Fi.

Technologies: C, PSP SDK, Python
