

noxx

Frontend Developer

Uruguay · noxxzeraa@proton.me · github.com/noxxUY · noxxuy.github.io

Summary

I build browser-only tools that open binary game formats: Minecraft worlds and GTA archives, parsed and rendered in 3D on the client, nothing uploaded. I am comfortable below the surface too: C++, reverse engineering with IDA Pro and undocumented file formats.

Skills

Languages: TypeScript, JavaScript, C++, HTML, CSS

Frontend: React, Astro, Vite, Tailwind CSS, Three.js, WebGL, File System Access API, Origin Private File System

Tooling: Vitest, Puppeteer, Git, GitHub Actions, npm

Low level: Reverse engineering, IDA Pro, Binary file formats (RenderWare DFF/TXD, IMG, Minecraft Anvil/NBT), Game modding in C++ (GTA: San Andreas)

Projects

IMG Editor

Independent project · Sep 2026 – present

Browser-based IMG archive editor for GTA III, Vice City and San Andreas. Opens the game archives and lets you browse, extract, replace, add, delete and rebuild entries, with a 3D preview of every DFF model and TXD texture. Saves in place through the File System Access API. Nothing leaves your machine.

- RenderWare DFF and TXD parsers written from the binary format, including skinned peds and PS2-format textures.
- The test suite parses every model of real GTA III, Vice City and San Andreas installs.
- Texture lookup through .ide files, with a texture index built in the background when nothing matches.

Technologies: TypeScript, React, Vite, Tailwind CSS, Three.js, Vitest

Minevisor Workspace

Independent project · Aug 2026

Read a Minecraft Java world in the browser: map, 3D terrain, players, inventories, chunks and NBT. Point it at a .minecraft save and it decodes region files and player data locally: a 2D map with player markers, a 3D voxel flythrough, side-by-side player stats, searchable inventories and raw chunk and NBT inspection. Inventories, experience and spawn points can be edited and saved back.

- Textures streamed from Mojang's CDN through a precomputed byte-offset index instead of bundling assets.
- Supports saves from Minecraft 1.0 onward, including the legacy terrain formats.
- Runs entirely client-side: no uploads, no server.

Technologies: TypeScript, Astro, React, Three.js, Tailwind CSS

Minevisor Transfer

Independent project · Aug 2026

Copy a Minecraft Java player's inventory between accounts, entirely in the browser. Moves the hotbar, main inventory, armor, offhand and ender chest from one account to another, offline to premium or the other way around. Resolves premium UUIDs from the Mojang API, derives offline ones locally, and writes new .dat files or straight into the world folder.

- Works between offline and premium accounts in both directions.
- Shares the NBT parsing core with Minevisor Workspace.

Technologies: TypeScript, Astro, React, Tailwind CSS
